Clay Electric Cooperative, Inc.

A Touchstone Energy® Cooperative 

## Trustee Angus Hastings passes away

Angus Hastings, a member of Clay Electric Co-op's board of trustees since 1965, passed away on Sunday, May 25 following a brief illness. A resident of Fort McCoy, Mr. Hastings, 87, represented Clay Electric members in District 9, which encompasses portions of Marion and Putnam counties.

Hastings had many years of distinguished service within the electric cooperative program at a state and national level. He served as president of Clay Electric's board for 10 years. Hastings was also active with the National Rural Electric Cooperative Association (NRECA) in Washington, D.C. In 1981-82, he served as president of the NRECA, which represents 900 electric co-ops in 47 states.

Hastings served as chairman of the NRECA's Legislative, Operations, and Building committees. At the state level, he served as chairman of the Florida Electric Cooperatives Association's Legislative and Governmental committee. He was also chairman of the Florida Action Committee for Rural Electrification (ACRE), part of a national political action committee for electric co-ops. In 2013, Hastings was honored by the NRECA with the ACRE Lifetime Achievement Award.

Survivors include his wife, Karen; two sons; three sisters; four grandchildren and seven great grandchildren.

"Our thoughts and prayers are with the Hastings family," said Ricky Davis, Clay Electric's general manager/CEO. "Angus dedicated almost 50 years to serving Clay Electric members in his own district and across our service area, and was also a state and national leader. We will miss his spirit and his leadership."

Hastings

## NEWS IN BRIEF...

### LONGTIME EMPLOYEE RETIRES...Sherman

Phillips, energy services manager in the Member & Public Relations Department, retired on May 30 after 32 years of service. Sherman supervised many of the co-op's programs to assist members in using energy wisely and protecting their homes, including energy surveys, efficiency rebates, conservation loans and surge protection. He also worked with members interested in installing solar-generated power on their residences. Derick Thomas, director of Member & Public Relations, said Sherman truly had the best interests of the co-op's members at heart. "Sherman understands what it means to work for a cooperative and to serve the member," he said "His presence at the co-op will be missed."

Phillips

### SALES TAX LOWERED...

A change made by the Florida Legislature this session reduces the sales tax on business purchases of electricity. This change affects mostly non-residential accounts and saves approximately 50 cents on each \$1,000 billed for electricity. This change was made via a provision in House Bill 5601 which allows for an annual shift of \$160 million from General Revenue to the Public Education Capital Outlay Fund. This was accomplished by reducing the sales tax on business purchases of electricity (which goes to the general revenue fund) and increasing the gross receipts tax on that electricity (which goes to PECO). Statewide, this will save businesses \$3 million annually.

# The General Manager's Report

**Ricky Davis**

## Do you have a disaster plan?

**H**urricane preparedness may not be the most riveting topic. When there's no immediate threat, no storm headed our way, it's easy to put things off.

Complacency is natural, since it has been a decade since major storms struck this region.

However, 2010 was the second busiest hurricane season on record, based on the number of named storms.

This year's forecast calls for a quieter hurricane season with experts suggesting that nine tropical storms will form, but only three will become hurricanes.

Even with that prediction, Floridians know that anything can happen during hurricane season. Now is a good time to make plans, and that is why we're providing this hurricane preparedness guide. It can help you make plans and ensure your family and property are secured should a major storm head our way.

This issue of the Kilowatt is filled with preparation tips and information about storms and our power restoration process. We hope it is beneficial.

Here are some important tips:

### **Get the whole family involved**

It's essential that everyone knows early on what the plan is, and his or her role in it.

### **Decide where you want to be during a hurricane**

This may be the toughest decision, so make it early.

Authorities recommend you prepare well and stay home if you are not in an evacuation zone. If you decide to go to a shelter, a friend's house or a hotel, don't go too far or you'll risk getting trapped on gridlocked

roadways.

You can get out of town, but unless you go early, it may pose so many problems that home or a local shelter may be a better alternative.

Study all the choices and decide -- now -- which is best for your family. Be specific in your planning and be sure to include pets in those plans.

### **Decide what to do if your family gets separated**

Have a designated meeting place, and a backup.

Tell others about your plan.

Tell at least two family members who live outside your area what you're going to do in case of a hurricane. If you're staying put, let them know and try to communicate with them afterward. If you're leaving town, tell them where you're going. If you change plans, let them know.

### **Involve all members of the family**

Involve everyone in the family, especially children, in your preparations. Each family member should have responsibilities so work is shared and nothing is overlooked. You're all in this together.

### **Make preparations for children**

Decide now who picks them up from school during a storm threat if both parents work.

Start helping them now to deal with any fears: explain what a hurricane is, what it can do, and what preparations you are making.

### **Prepare for those with special needs**

Make arrangements right away for family members who are elderly or who have special

needs.

Remember, if someone depends on electrical life

support, there probably won't be power after a storm. Contact your local Emergency Management Office for details.

### **Keep some emergency cash**

A hurricane will disrupt banking schedules. ATMs and credit cards, in a world without electricity, will not work or will run out of cash. Don't charge your credit cards to the limit; you may need them to get more cash after the storm.

### **Buy supplies early**

Planning is key to avoiding price gougers who appear after calamity strikes. Buy as many supplies as you can, especially big-ticket items like generators, before a hurricane threatens and demand skyrockets.

### **If damage is extensive, power will be out for 7 to 14 days**

If a major hurricane strikes North Florida, it's likely Clay Electric's distribution and transmission system will suffer heavy damage. It could take a week or more to restore service.

Some outages will be longer. Your plans should include preparing for a prolonged power outage. If a medical condition or other situation makes a prolonged outage a serious hardship, then you should have an alternate source of power available, like a portable generator. Relocation is another option.

# Hurricane

## Special Section

Clay Electric Co-op offers this information to help you protect your loved ones and property when a hurricane threatens our region.

### DON'T WAIT...

until the last minute to begin preparations. Stock up on needed items at the beginning of the hurricane season and take necessary steps to protect your family and home when the first watches are issued.

## Things to consider before the storm hits

**1** A **Hurricane Alert** is announced when a hurricane poses a possible threat to an area. If the hurricane is believed to be an appreciable threat, the area is put on a Hurricane Watch. Tune to your local news station for further advisories. Safety precautions should be started if an Alert is announced.

A **Hurricane Warning** is issued when it is expected an area will be hit by a hurricane. At this time, all safety precautions should be taken. If you live in a low-lying area prone to flooding, be ready to evacuate early. Pre-storm rains and flooding may cut you off if you don't move soon enough.

If you are asked to evacuate, do so as quickly as possible. Bring necessary medications and such children's needs as diapers and baby food. Also bring blankets and pillows. Understand that most shelters do not allow pets.

**Stay away from beaches** or other low areas which may be flooded by high tides. Haul boats out of water and tie down or strongly moor them.

**Mobile homes are particularly vulnerable** to winds of hurricane force. You should move to safe shelter when a hurricane warning is given. You may want to secure all outdoor objects and awnings over doors and windows, and tape or board windows and doors. Do not stay in your mobile home during a hurricane.

**Stay at home if your house is safe** from high water and flash flooding. Bring in everything that could blow away – garbage cans, garden tools, furniture and plants. Remove limbs from trees that could damage your house or utility wires. When you're taking down limbs or antennas, keep in mind that even the slightest contact with a power line can cause a fatal electrical shock.

**Turn your refrigerator and freezer to colder settings.** Open only when absolutely necessary and close quickly. If used carefully, a good refrigerator/freezer can maintain food-preserving temperatures up to two days without electricity. Fill empty spaces with frozen plastic jugs of clean water.

**Prepare your emergency water supply.** Sterilize the bath tub and other jugs, bottles, pots and other containers. Scrub thoroughly, let dry and fill with water. Boil this water before drinking.

**Secure garage doors, shutters, awnings** and brace sliding glass doors and French doors. Board windows securely with plywood.

*"Failure to prepare for a hurricane could be the difference between life and death. Ultimately, if individuals don't create their own hurricane plan, this is all for naught. We live in paradise, and that is the price we pay."*

- Former Florida Gov.

Jeb Bush, speaking at the 2005 Governor's Hurricane Conference in Tampa.

## Hurricane Checklist...

- Battery-powered radio
- Extra batteries
- Flashlights
- Extra flashlight bulbs
- Lantern
- Fuel
- Matches
- First aid kit
- Bleach
- Plywood to cover windows
- Emergency cooking supplies
- Manual can opener
- Pantry well stocked with canned goods, drinking water, baby food, etc.
- Extra medicine
- Extra ice in freezer
- Tub filled with water
- Full tank of gas in vehicle
- Important papers in a water-proof and portable container
- Pets protected or inside
- Loose outside objects stored or secured
- TV antenna taken down

## Things to consider during the storm

**2** Stay indoors. Don't go out at all, except in emergencies. Stay tuned to your local news station for up-to-the-minute advisories and remain indoors or in a shelter until the all clear announcement is given. Use your phone for emergencies only.

If the electricity goes out, use flashlights instead of candles or kerosene lamps when possible. Be careful with cooking flames. A gust of wind through a door or window could start a fire and the fire department may not be readily available during the hurricane.

If the eye of the hurricane passes directly over your area, skies may clear and there may be a lull in the wind that lasts a few minutes or a half hour. Remain in a safe place. If absolutely necessary, make emergency repairs quickly. Be careful, the wind will return from the opposite direction suddenly and maybe with even greater force.

## Things to consider after the storm

**3** Stay away from disaster areas so you don't hinder first aid or rescue work. Be on the alert for rising water in streams and rivers even after the heaviest rain has ended.

Stay away from broken or low-hanging power lines, as well as metal objects which may be in contact with damaged power lines.

Be assured your co-op will restore electric service as quickly and safely as possible. The co-op has an emergency plan to follow that allows power to be restored to as many customers as quickly as possible. First, power is restored to substations. Next, main feeder circuits are brought back on line. Then work crews repair secondary lines and tap lines. Finally, individual customers still without power are concentrated on. See story at right on this page for more about this topic.

If you have lost power during the storm, it is not necessary for you to immediately call and report your power outage. Clay Electric's automated equipment identifies main feeder lines that are not in service. You're asked to help keep the phone lines open for emergency calls only. If your neighbors have had their electricity restored and you're still without power, please call the co-op's outage reporting line at 1-888-434-9844.

If you use a portable generator during an extended outage, do not connect it to your home's wiring unless your home is equipped with a double throw-back switch installed by a licensed electrician and you understand its proper use. For more about portable generators, please see additional information in this section.

To report an outage or damage on Clay Electric's lines, call our toll free outage reporting line, 1-888-434-9844.

For life-threatening situations, call 911.

## Restoring your power after the storm - a look at the restoration process

If a hurricane should cause widespread power outages in Clay Electric's 14-county service area, co-op personnel will be involved in the power restoration process even before the storm leaves the area. They will continue their efforts, with the help of many crews from other areas of Florida and from other states, until your power has been restored.

Understand the co-op's concern for the safety of its employees means no outdoor work will be performed during dangerous high-wind conditions. As soon as conditions allow, employees will be out in force assessing the damage to the system and getting the restoration effort underway.

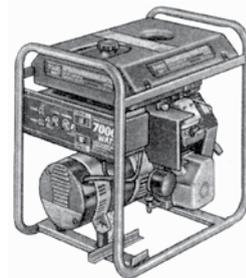

Electric utilities follow a specific restoration plan during widespread power outages. The first step is repairing transmission lines, which carry high voltage electricity from generating plants to transmission substations. Transmission substations are also among the first items to be repaired.

Next to receive the attention of repair crews are the distribution substations and their respective main feeder lines. The co-op has over 50 substations on its system and there are about 12,000 miles of distribution lines, which carry power out from the substations to homes and businesses.

*Continued on page 7*

# Important information on the safe & proper operation of generators

The power outages caused by hurricanes have created a lot of interest in generators. If you are shopping for a generator or have already purchased one, please keep the following information in mind.

## Safety First

It is extremely important to follow all the instructions provided by the manufacturer of the generator. An improperly connected generator can create a dangerous situation because it can backfeed electricity into Clay Electric's distribution system. This situation could result in serious injury or death to an unsuspecting co-op lineman, a neighbor or family member. Never operate a generator inside an enclosed area. Carbon monoxide gas produced by a gasoline or propane engine can cause death. Generators should be operated in well-ventilated areas, a minimum of 10 feet from operable windows and doors.

A word of caution: Residential portable generators are not designed to be operated continuously. We recommend running a generator during emergency situations for a few hours, then shutting it off for a short period of time. This helps conserve gas/propane since they may not be readily available for the first few days after a major storm. Never leave a generator running when the home is unoccupied. Also, portable generators should be run for 10 minutes monthly to prevent stagnant gas from gumming up the carburetor.

## About Generators

There are two basic types of generators – (1) Portable and (2) Standby.

**Portable** generators are designed to supply auxiliary power to specific appliances/equipment using extension cords. Most portable generators are mobile, gasoline fueled and electric or manually started. They may cost from \$500 to \$2,000 or more. The rated wattage of portable generators is from 1,500 to 15,000 watts.

**Stand-by** generators are designed to be hard-wired to the home's electrical system. They automatically operate when there is a power interruption and they shut off when the utility power is restored. They are powered by LP, natural gas, diesel fuel or gasoline and they should be installed by a licensed electrician.

For both types of generator, the size (watts) of the generator determines the number of appliances/equipment you can safely operate at one time. Any appliance/equipment with a motor or compressor will draw more current during start-up than during normal run time. The start-up of these motor/compressor loads must be considered when sizing a generator for your needs. The extension cords used with a portable generator also should be properly sized to handle the electrical requirements of the appliance. See the appliance usage chart on the next page to help you determine the total amount of watts you may need.

Standby generators use a transfer switch designed to connect certain electrical circuits within a home to the generator. You must determine which electrical circuits you want to be supplied with auxiliary power. A licensed electrician should install the transfer switch. The standard transfer switch costs between \$300 and \$500 and has the capability of connecting 6 to 12 circuits to the generator.

## How Should I Maintain the Generator When Not in Use?

Gasoline with ethanol as an ingredient can damage parts of a generator's engine and cause seals to deteriorate if this fuel is left in the engine for long periods. However, if you drain the gas and leave the engine empty, the o-rings can dry out and cause the gas tank to leak. To avoid seal damage, use a fuel stabilizer and run your generator monthly for 10 minutes.

Watch the video:  
**Portable & Standby  
Generator Safety**  
on  
[youtube.com/ClayElectricCoop](https://www.youtube.com/ClayElectricCoop)

# Appliance Usage Guide

Use this Appliance Usage Guide to estimate the power requirements of various appliances/equipment. This will help you determine the size generator you may want to purchase.

Appliance/Equipment	Running Watts (avg.)	Starting Watts (avg.)
Water Pump ½ HP	1,000	3,000
Water Pump ¾ HP	1,500	4,500
Sump Pump	1,000	3,000
Refrigerator	750	1,500
Freezer	500	1,000
Microwave	600-1,500	
Lights	40-200	
Television	150-400	
Radio	6-15	
Oscillating Fan	50-100	
Water Heater	4,500	
Coffee Maker	750-1,200	
Toaster Oven	1,100	
8000 BTU AC (window unit)	1,000	3,000
3 Ton A/C or Heat Pump	6,000	32,400
Garage Door opener	500	
Laptop Computer	1-15	
Cell phone charger	3-6	
Home Security System	24	

This appliance usage guide is the estimated average usage of electrical equipment. Generators have to be sized large enough to handle the starting wattage of motorized equipment. A 5,000 watts generator will handle the operation of appliances listed above except the 3 ton A/C or heat pump. All appliances can't be in operation simultaneously but you can control the sequence of operating time.

## Restoring power...

*From page 5*

The number of members served by each of Clay Electric's distribution substations can range from a few hundred to nearly 9,000 – so getting the substations back in service is essential. Individual tap lines are next in the restoration plan because they serve the fewest number of members.

Essential Service Accounts include hospitals, law enforcement, fire, radio and television stations, cell towers and water providers. Of course, these accounts are given a priority status in the restoration process because they are essential to community safety, health, and communications.

Rebuilding large portions of a distribution system that stretches into 14 counties takes time, and the understanding and patience of members during a time of extended outages is helpful.

## Hurricane names for 2014

A storm must start as a Tropical Depression and move on to become a Tropical Storm before it is given a name. Once a storm is named, preparations for the possible hurricane should be well under way.

Here is the list of hurricane names for 2014: Arthur, Bertha, Cristobal, Dolly, Edouard, Fay, Gonzalo, Hanna, Isaias, Josephine, Kyle, Laura, Marco, Nana, Omar, Paulette, Rene, Sally, Teddy, Vicky and Wilfred.

If we're unlucky enough to deplete the year's supply of names, we won't simply start using names from next year's list, contrary to popular belief. In that case, the National Hurricane Center will turn to the Greek alphabet and we'll have Hurricanes Alpha, Beta, Gamma, Delta, etc.

### SCRIPTURE

It is not good to have zeal without knowledge, nor to be hasty and miss the way.

Proverbs 19:2

# Test your hurricane I.Q.

- A hurricane is immediately preceded developmentally by which of the following?
  - A tropical wave
  - A tropical depression
  - A tropical trough
  - A tropical storm
- True or false? You should leave one window open during a hurricane to prevent your house from exploding.
  - True
  - False
- By what scale is a hurricane's strength measured?
  - Fujita
  - Richter
  - Saffir-Simpson
  - Mercalli
- In the Northern Hemisphere, which direction do a hurricane's winds rotate?
  - Counter-clockwise
  - Clockwise
- At what wind speed does a tropical storm become a hurricane?
  - 39
  - 50
  - 74
  - 100
- How many Category 5 hurricanes have hit the United States since 1899?
  - 3
  - 4
  - 5
  - 6
- On average, what are the peak months of the hurricane season?
  - June/July
  - July/August
  - August/September
  - September/October
- What was the costliest hurricane in U.S. history?
  - Camille
  - Opal
  - Katrina
  - Andrew

**Answer Key:**

- 1(d) 2(b) 3(c) 4(a) 5(c) 6(a) 7(c) 8(c)

## Additional preparation tips to consider...

*Additional things to consider as you make your hurricane preparation plans that could help you better cope with an extended outage.*

- When freezing water in containers to help keep your food cool during an extended outage, use the largest containers you have room for. Larger blocks of ice last longer than cubes or crushed ice.
- Buy a cot and sleep in the coolest spot in the house. Sleeping on the floor or on an air mattress offers no breeze or draft.
- Cell phones are a lifesaver, but not necessarily when a hurricane knocks out the power. An old-fashioned telephone that's plugged into the wall may be invaluable when the phone batteries die. In a pinch, you might be able to charge your cell phone in the car (don't run the vehicle's engine in an enclosed garage!).
- You have power but your relatives don't, and they're on their way? Ask them to bring extra food and supplies so there won't be any shortages at your home. A hurricane is enough of a stress, and to run short of supplies because of the extra mouths to feed can make things even worse.
- Keep an extra tank of propane on hand for the gas grill or cooker during the hurricane season.

Make sure you have an extra tank of propane on hand for the gas grill or cooker.

## Recipe Corner

### Banana Sour Cream Bread

#### Ingredients:

- 1/4 cup white sugar
- 1 teaspoon ground cinnamon
- 3/4 cup butter
- 3 cups white sugar
- 3 eggs
- 6 very ripe bananas, mashed
- 1 (16 ounce) container sour cream
- 2 teaspoons vanilla extract
- 2 teaspoons ground cinnamon
- 1/2 teaspoon salt
- 3 teaspoons baking soda
- 4 1/2 cups all-purpose flour
- 1 cup chopped walnuts (optional)

#### Directions:

- Preheat oven to 300 degrees F (150 degrees C). Grease four 7x3 inch loaf pans. In a small bowl, stir together 1/4 cup white sugar and 1 teaspoon cinnamon. Dust pans lightly with cinnamon and sugar mixture.
- In a large bowl, cream butter and 3 cups sugar. Mix in eggs, mashed bananas, sour cream, vanilla and cinnamon. Mix in salt, baking soda and flour. Stir in nuts. Divide into prepared pans.
- Bake for 1 hour, until a toothpick inserted in center comes out clean.

## Youth Tour provides fun, educational experience

Clay Electric's Youth Tour to Washington contest winners enjoyed an activity-filled five days visiting the nation's capital and touring of monuments, museums, legislative buildings and historic landmarks. They were accompanied by Todd Martin, member relations representative for the Gainesville District.

Students from 11 Florida electric cooperatives toured the National Cathedral, the Smithsonian, Holocaust Museum, war memorials, and many other historic sites.

This year's winners of Clay's Youth Tour to Washington trip contest are Brendan Register, Savannah Woodall, Christine Boettcher and Bailey Creighton.

On the first afternoon, they toured the World War II Memorial and the Holocaust Museum.

On Sunday, they visited Arlington National Cemetery and the Korean, Lincoln, Vietnam, FDR and Jefferson memorials.

On Monday, the students participated in Youth Tour program activities at the Hyatt Hotel, saw Pentagon City and the National Cathedral, and visited the Newseum. That evening, the group took part in a Potomac River cruise and dance.

Tuesday's activities included a visit to George Washington's Mount Vernon home. The day's schedule also included a tour

of the Air and Space Museum in Chantilly, Va. and a stop in Pentagon City for dinner. Afterwards, they saw the U.S. Marine Corps Sunset Parade.

Wednesday's itinerary included touring the museums, the Smithsonian, and the Mall area. That evening, the students took in the musical "The Lion King" at the Kennedy Center.

In handwritten notes turned in at the end of the week, all of the students expressed gratitude for being selected to go on the trip and said the entire experience provided them with many new experiences and learning opportunities.

"I had the opportunity to see my nation's capital, meet new people, make new memories and expand my horizons," Bailey Creighton wrote. She also said the trip was executed flawlessly due to the time and care of the organizers.

Christine Boettcher said she will be grateful for the experience for the rest of her life.

"I don't think our trip could have been any better," she said. "We were able to visit a multitude of monuments, museums, see the White House and visit the capital. The ability to visit Rep. Ted Yoho in his office was also a unique opportunity that I am very appreciative of."

Brendan said the trip allowed him to gain a better, first-hand

understanding of his country and its government.

"Not only does our nation's capital show the dedication and respect held for those who serve or have served, but it also inspires a deep sense of patriotism and pride," he wrote. "From the black marble of the Vietnam and Korean War Memorials to the climbing stone blocks of the Washington Monument, it is a fact that after traveling to the city on the Potomac, one will have a greater sense of our government and a greater pride in our nation."

Savannah said the trip gave her a renewed appreciation for living in the United States.

"Overall I am extremely grateful for the opportunity to learn more about my nation," she wrote. "I know it would not be possible without the generous support of my co-op. Truly this trip was once in a lifetime and I will never forget it."

As their chaperone for the week, Martin said Clay's students were outstanding. He said when he asked them what the 'greatest moment' of the trip had been, they all told him it was the opportunity they each had to be a part of it.

"The students were great," he said. "Every day they had a new experience and learned something."

# Clay Electric and Seminole express concern over EPA Clean Power Plan

On June 2, the federal Environmental Protection Agency (EPA) unveiled a proposed rule aimed at reducing greenhouse gas emissions from existing fossil-fueled power plants, including coal and natural gas-fired facilities.

Specifically, the EPA proposes its "Clean Power Plan" to reduce power sector carbon emissions 30 percent below 2005 levels by 2030.

Since Seminole will generate nearly 60 percent of its energy from coal this year, the EPA's proposed rule is significant to Seminole and the nine member-systems it serves (including Clay Electric).

"The purchase of wholesale power from Seminole is 73 percent of Clay Electric's total budget, so we are following this issue very closely," said Derick Thomas, Director of Member and Public Relations.

From the beginning, Seminole's fossil-fueled generating plants in Putnam and Hardee counties were built with a concern for the environment. One of Seminole's highest priorities is to make certain that all its generating resources are operated in an environmentally responsible manner.

For its leadership in environmental stewardship, Seminole received a Sustainable Leadership Award from the Council for Sustainable Florida.

"Some of our members may not know that Seminole's coal-fired generating station in Putnam County was named the sixth cleanest power plant in the world by Power Magazine," Thomas said.

Thomas said Seminole has invested more than \$530 million in environmental control technology and recycling practices.

Approximately 70 percent of the byproducts produced at

The Seminole Generating Station is located on 2,000 acres in Putnam County, just north of Palatka. SGS uses modern technology for environmental protection. SGS has more than \$530 million invested in pollution control equipment, making it one of the cleanest coal plants in the United States. Just as important, it is also one of the most reliable plants in the country.

Seminole's coal-fired plant are recycled for use in common construction products, including wallboard and concrete.

Seminole's renewable energy resources include waste-to-energy facilities, landfill gas-to-energy facilities, and a biomass facility. Collectively, these contracted resources will provide more than seven percent of Seminole's member electric needs in 2014.

In order to comply with the EPA's Clean Power Plan, utilities will likely shift most of their generation to natural gas. This will lead to higher natural gas prices and less fuel diversity. Seminole believes fuel diversity lowers exposure to changing market conditions and supply disruption events, such as a hurricane shutting down natural gas wells along the Gulf coast.

Seminole Electric Cooperative meets and quite often exceeds state and federal environmental emissions regulations. However, the EPA's regulation of carbon dioxide presents an entirely

different concern, because there are no commercially available technologies to capture CO<sub>2</sub>. Under these circumstances, the EPA's insistence that utilities capture CO<sub>2</sub> will result in drastic rate increases for co-op members if more reasonable and achievable proposals are not adopted.

Clay Electric supports the development of renewable energy sources like solar, wind and hydro, but the co-op recognizes that wind and hydro are not reliable energy sources in Florida at this time. Solar power does supplement almost one megawatt of Clay's daily generation needs, but currently just is not capable of providing the 24-hour generation that nuclear and fossil fuels do.

Seminole will be studying the EPA's Clean Power Plan to learn more about its potential impact. Information will be shared with co-op members when more is learned. We encourage members to visit our website or like us on Facebook for information as it becomes available.
