Clay Electric Cooperative, Inc.

A Touchstone Energy® Cooperative 

Contractor to conduct GPS inventory of co-op's system

How would you like the job of visiting every utility pole in Clay Electric's 14-county service area? It might take you a while to count the nearly quarter of a million poles in the co-op's distribution system.

That's just what will be happening during a year-long project that will begin in June. Clay Electric has contracted with Davey Resource Group (DRG) to do a complete inventory of Clay's system.

Members might notice these employees as they visit each pole and individual piece of distribution equipment to record the item's Global Positioning System (GPS) coordinates. Employees from Davey Resource Group will also be recording each meter in the system. This means they will be at the house or meter pole in every member's yard. They will be driving trucks that display both the DRG logo and Clay Electric's logo. In some areas it will even be necessary to use a four-wheel all-terrain vehicle (ATV) to reach facilities.

The company is performing this inventory by contract for Clay Electric in order to have the most accurate, up-to-date maps possible. Accurate maps are an important part of the co-op's toolkit. With maps, Clay Electric can plot power lines, locate problems more quickly and plan for future growth. Clay Electric has grown rapidly through the years, and the maps that have been developed over the last 50 years are not always accurate.

While Clay has been using geographic information system (GIS) maps, this project will allow the GIS maps to be corrected and have the same accuracy as GPS.

Members can expect to receive a notification letter in the mail prior to the DRG employees working in their neighborhood.

Since Clay Electric has 63 substations serving 187 feeders and many other fixed components that make up the utility's electric distribution system, the project is quite extensive and is expected to take about a year to complete.

NEWS *IN BRIEF...*

NEW LAW REQUIRES ENERGY EFFICIENT POOL PUMPS...

If you need to replace a broken or aging pool pump in the near future, you may need to upgrade to a more energy-efficient one. A new Florida law went into effect this year that bans the sale and installation of single-speed pool pumps with one or more horsepower. When selecting a new pump, homeowners will be required to buy one capable of operating at a minimum of two speeds unless the old model can be replaced under warranty. The co-op recommends contacting a certified or registered pool contractor with any questions you may have about the new law. Keep in mind that by maintaining your pool's cleanliness, water clarity, and chemical levels, you may be able to reduce your pool pump's run time and save money. Clay Electric recommends you limit the run time for your pool pump to four hours each day in the winter and six hours each day in the summer.

The General Manager's Report

Ricky Davis

New member benefit, Co-op Connections, is found in this issue of the Kilowatt

I'm glad to report that your Co-op Connections card has finally arrived.

For the past few months, we've been promoting the many benefits and features this discount card program offers.

This month, we've enclosed a Co-op Connections card in this issue of the Kilowatt. You can start using your discount card right away at participating businesses and pharmacies throughout our 14-county service area.

We believe Clay Electric's commitment to its members goes beyond providing safe, reliable and affordable electricity. As part of the seven guiding principles of cooperatives, a "Concern for Community" reflects our desire to provide more value to our members.

Our board of trustees believes, as I do, that Clay Electric should have a positive impact in the communities we serve. Offering a Co-op Connections card program to our members shows that the benefits of co-op membership are broader than just meeting your power needs.

Our Co-op Connections program is designed to deliver added value to our members — whether they're residential or commercial accounts — by offering valuable discounts at participating local and national businesses. The card connects

Members can find their Co-op Connections card inside this issue of the Kilowatt. Be sure to detach your card and keep it handy when you go shopping at businesses where the card is accepted.

our members with discounts on everything from hotel stays to prescription drugs. Even better, our Connections program is part of a national discount program used by more than 400 electric co-ops across the nation, so your discount card is good at participating businesses in many other states!

The pharmacy discounts offered through the Co-op Connections card program are widely used. According to Touchstone Energy, participating members have a combined savings of \$40 million on prescriptions since the program began.

Whenever you show your Co-op Connections card at participating businesses, you'll receive a discount. These merchants, in turn, benefit from increased customer traffic. So far, 121 local businesses have signed up.

How do you know which businesses are enrolled in our

Co-op Connections program? Participating businesses have been asked to place Co-op Connections stickers in their windows or on their cash registers. As we move forward with this program, more and more businesses will sign up.

There's lots of information available about our Co-op Connections card program online. Our members can visit our website — www.clayelectric.com — and follow the links to see the list of participating businesses.

You can also log on to www.locateproviders.com to search for pharmacies in our area that honor the card. Use code 22203 as the group number under the "Groups" login section. The next step is to enter your zip code.

We look forward to our members enjoying the benefits of our Co-op Connections card program. Call us if you have questions.

So while our number one priority is keeping the lights on, we're also committed to offering you additional value through our Co-op Connections card program. We believe our Co-op Connections program is another way to accomplish that goal. That's the cooperative difference.

Putnam schools make saving energy a priority

Like most of us, the Putnam County School District has been concerned about the rising cost of electricity. The district has an active program for conserving energy that has greatly reduced energy use and saved a lot of money.

As of last spring, the district had reduced energy consumption by over 21 percent and lowered their power costs by \$2 million over 62 months.

Because the cost of utilities is the second largest budget item for Putnam County Schools, the district made a commitment many years ago to use conservation and efficiency methods to work toward lowering that expense. The district has made energy management a priority for 15 years, but two years ago added energy management duties to a staff member's responsibilities. One of those duties is monitoring usage in every school facility. The systems in place provide for temperature setpoint and tight schedule control for all the District's campuses.

According to Tank Motes, a consultant for the school district, the district is number one in the state for lowest energy expenses for districts with more than 1,000 students. For the 2010-2011 school year, Putnam County schools had a per-square-foot total energy cost of 81 cents. The electricity costs per square foot was 77 cents. The majority of school districts in Florida have electricity expenses of \$1 or more per square foot.

In a typical school building, space heating, cooling, and lighting together account for nearly 70 percent of school energy use. Plug loads—such as computers and copiers—also constitutes one of the top three electricity end uses.

Motes said the biggest items were either tackled as soon as possible or factored into five-year plans. He noted that with the district's schools being served by both Florida Power and Light and Clay Electric, both electric utilities have been good to work with. Clay serves Q.I. Roberts Middle, E.H. Miller School, Kelley Smith Elementary, Children's Reading Center Charter, Melrose Elementary and Ochwilla Elementary.

Educating more than 12,000 students and maintaining more than a million square feet of facilities space at 23 sites makes cost savings a challenging task. Some of the ways they saved energy include:

- **Monitoring:** Pulse meters allow the monitoring of daily kilowatt hours. This allows the district personnel to see any spikes in usage or other changes. This can mean catching a problem before it becomes a much more expensive issue.
- **Lighting:** The district has been installing more

efficient electronic ballasts in classrooms. They have gone from T12 to T8 lamps and from 40-watt to 32-watt bulbs. There are still three schools left to convert.

- **Maintenance:** The district uses an air filter changing service to maintain its air conditioning systems. Just like in homes, the air conditioners in schools must be properly maintained in order to function most efficiently.

- **Behavior:** The staffs and students at the schools are encouraged to turn off lights, shut off electronic devices (such as computers) and close doors, just like at home.

Motes said the installation of a Mamac Maverick system, which allows all connected buildings to have their energy use monitored remotely, has proven helpful. He added that the portable buildings and classrooms have been challenging in terms of modifying energy use.

"It was interesting to discover that over half of the district's energy use was occurring when nobody was at a school," he said.

The school district is constantly watching for new products and strategies for saving additional energy when they find uncontrolled loads. Last year, when the monitoring revealed considerable electric usage when school facilities were vacant, the District began to address the many portable classroom units that have been so difficult to control. A new product manufactured by Mamac Systems called the Maverick Stat, which is currently being installed, provides web-based temperature control and scheduling, trend logs for assuring performance, and email alarms for identifying problems for the maintenance department personnel. The Maverick's low cost is making it practical to control loads in remote areas that before had been cost-prohibitive to control.

Sherman Phillips, energy services manager for Clay Electric, praised the work of the school district.

"These are areas all businesses, and even homeowners, can focus on to reduce their energy use," he said. "The cost savings over time prove that even small changes can really add up."

Tank Motes and Sherman Phillips look at the cooling tower that was installed last summer at Ochwilla Elementary School. In conjunction with the tower, frequency drivers allow for the lowering of water flow during times when air conditioning is not needed. These upgrades allow for better cooling and efficiency.

Energy Smart rebates benefit members who make energy efficiency upgrades

Clay Electric's Energy Smart Rebate Program has been popular with members since it was introduced just over three years ago.

The Rebate Program helps members lower their energy use, which results in lower monthly power bills. It also helps the co-op reduce its demand for wholesale electricity during peak demand times, said Sherman Phillips, manager of the co-op's Energy Services Division.

From October 2007 to May 2012, 4,927 rebates have been issued that total \$1.21 million. The energy efficiency improvements associated with those rebates will help participating members lower their combined energy usage by more than 25.5 million kilowatt hours. These savings will be recurring annually.

Rebates are available for attic insulation, high efficiency heat pumps, solar water heating, window film, spray foam attic insulation, heat pump water heaters and heat recovery units.

The Basics

Rebates are available to Clay Electric residential members who are making efficiency upgrades to their primary residence and small commercial facilities (located on the co-op's lines). The residence can be a conventional site-built or manufactured home. To qualify for a rebate, the member must complete and submit an application and accompanying documents to the Energy Services Division of CEC within 180 days of the energy efficiency improvement work completion. Rebates will be made after verification by a Clay Electric representative that the work has been completed and the county has made its final inspection.

Ceiling Insulation Upgrades

Today's Florida Energy Efficiency Codes (FEEC) require a minimum of R19 ceiling insulation. To receive a rebate, the existing insulation level must be less than R19 as determined by an insulation contractor or customer verification. This rebate is for existing residences only. The maximum rebate amount is \$600.

Heating, Ventilation and Air Conditioning

This rebate is offered to encourage the use of heat pumps that are more energy efficient than those currently required by the FEEC. (BTUs and SEER rating determine the rebate amount.) The new system must be replacing electric resistant (strip) heat with central air conditioning or less efficient heat pump(s). This rebate ranges from \$50 to \$500.

Solar Water Heating

This rebate is offered to encourage the use of passive or active type Solar Water Heating Systems. The proposed solar system must meet the Florida Solar Energy Center (FSEC) specifications and be installed by a contractor currently certified to install solar water heating systems by the Florida Department of Professional Regulation Construction Industry Licensing Board. The rebate is awarded based on system British Thermal Unit (BTU) output of \$0.01 per BTU. The rebate maximum is \$600. The collector must be positioned for optimum performance and guaranteed against freeze damage.

Window Film

This rebate is offered to help reduce the solar heat gain through glass/windows which ultimately contributes to air conditioning run time. To receive a rebate, the window film must have a Solar Heat Gain Coefficient (SHGC) of less than .45 and be applied to windows that have a western, eastern or southern orientation and are not shaded by porches, awnings or foliage. The value of the rebate is calculated at \$0.44 per square foot of glass area. This rebate is for existing residences or facilities only.

Heat Pump Water Heater

This rebate, valued at \$175, promotes more efficient heating of water than through a standard conventional electric resistant model. This rebate also applies to new construction.

Heat Recovery Unit

This rebate is offered to promote a more efficient way of heating water in conjunction with a standard conventional electric resistant model. Recipients of this rebate must be a CEC member and the heat recovery unit must be installed in the primary residence or facility receiving electrical service from CEC. The value of the rebate is \$200.

Members applying for rebates are encouraged to read and follow all application instructions carefully to make sure they are eligible for the rebates. For more information about Clay Electric's Energy Smart Rebate Program, call the Energy Services Division at (352) 473-8000 ext. 8263 or visit us at www.clayelectric.com.

Take control of your summer power usage by following these tips...

Summer is a fun time of year, but it also means hot, humid days, afternoon thunderstorms, plenty of pesky mosquitoes...and higher electricity bills.

You can't control the heat, storms or humidity, but you do have some control over your summer-time electricity usage.

It's a fact that as the outdoors warms up, your home experiences more heat gain. In response, you adjust the thermostat to remain comfortable.

Utilities often suggest a thermostat setting of 78 degrees. Why 78? An inactive person begins to perspire when the temperature rises above 78. But what happens if you're active and get too warm? You lower the thermostat. However, for every degree the thermostat is set below 78, the run time of your air conditioning unit or heat pump increases 5 to 8 percent. This ups your electricity usage.

Here's a few suggestions to help you lower your electrical usage during the cooling season:

- Have your air conditioning system serviced annually.
- The ductwork should be inspected to make sure there are no duct leaks. If leaks are found, have them sealed with approved aluminum tape or mastic. Duct tape isn't a fix-all for air conditioning ductwork.
- Keep all windows and doors closed when the air conditioner is in operation.
- Change the filter(s) monthly or whenever they show signs of dust accumulation. Higher quality air filters trap more dust particles, and they need changing as often as lesser quality filters.
- Keep air supply registers open to all rooms, even those not frequently occupied. Closing off air supply registers increases the air pressure on the duct system, and this ups the chances of duct leakage.
- Keep all interior doors to rooms with supply air registers open, unless a return air vent is located within the room. If you keep doors to rooms without return air vents closed, it does not allow for adequate air circulation and the temperature of the room will increase. Sound familiar?

If your home was built before 2003, it's likely the ceiling penetrations which allow the placement of electrical wiring, plumbing stacks, light fixture boxes, etc. weren't sealed. These penetrations allow hot, humid air from the attic to enter the conditioned areas. This increases the run time of your air conditioning unit. The reverse occurs in the winter.

Warm conditioned air from inside the home moves toward the attic. To reduce this heat transfer, all penetrations into the attic should be sealed. That's why building codes were changed in 2003 to require the sealing of all ceiling penetrations.

You can't control the summer storms or the outside humidity, but you can get a handle on your energy usage and lower your monthly bills. As for those pesky mosquitoes, try insect repellent!

Guide to saving energy while you're away

Clay Electric is proud to provide competitive rates to our members. While we know our rates are lower than most of our neighboring utilities, we want to help you save even more. If you're going on an extended vacation or you're a seasonal resident, use this checklist of top tips before heading out of town.

Prevent mold

- Set programmable A/C thermostats to run at 72 degrees for two hours before sunrise and 88 degrees the rest of the day. Set non-programmable units to 80 degrees.
- Maximize energy savings by using dehumidifiers instead of air conditioning. Place them near sinks and showers, with one for every 1,000 square feet, and set to 58 percent.

Prepare appliances

- Unplug or turn off the circuit breaker to the hot water heater.
- Set refrigerator to its warmest setting if leaving it on. If you unplug, remove all food, clean interior, dry thoroughly, leave doors open and turn off automatic ice makers.
- Unplug appliances and electronics.
- Check exterior security and/or motion sensed lighting for proper operation.
- If on well water, turn off the water to home and the electricity to pump.

Plan ahead

- Visit www.ClayElectric.com/payopt.aspx to make receiving and paying your Clay Electric bill easier while you're away.

SCRIPTURE

A good woman is hard to find,
and worth far more than diamonds.
Her husband trusts her without
reserve,
and never has reason to regret it.
Proverb 31:10

Recipe Corner

Blueberry Cobbler

Ingredients

- 1 pt. blueberries
- 1 (14 oz.) can Eagle Brand sweetened condensed milk (not evaporated milk)
- 2 tsp. grated lemon rind
- 3/4 c. plus 2 tbsp. cold butter
- 2 c. biscuit baking mix
- 1/2 c. firmly packed brown sugar
- 1/2 c. chopped nuts

Directions

In bowl, combine berries, sweetened condensed milk and rind. In large bowl cut biscuit mix until crumbly; add berry mixture. Spread in greased 9 inch square baking pan. In bowl combine 1/2 cup biscuit mix and sugar, cut in 2 tablespoons butter until crumbly. Add nuts. Sprinkle over cobbler. Bake at 325 degrees for 1 hour and 10 minutes or until golden. Serve warm with ice cream.
