Clay Electric Cooperative, Inc.

A Touchstone Energy® Cooperative 

NEWS IN BRIEF...

LARRY HORNE RETIRES; WAYNE MATTOX NAMED MANAGER OF COMMUNICATIONS...

Larry Horne, who managed the co-op's communications division and was one of the co-op's spokespersons, retired in October after 39 years of service. A graduate of the University of Florida, Horne was nationally known among electric co-ops as a communications professional. In 1987 he was the first communications professional among Florida co-ops to earn the status of Certified Cooperative Communicator (CCC). He served on a national review board for several years which evaluated the portfolios of other electric co-op communicators who were seeking CCC certification. Horne developed a number of communications campaigns during his tenure and his leadership in one of the co-op's communications efforts earned the co-op the Edgar F. Chesnut award, the highest communications award among the nation's 1,000 electric co-ops. "Larry was a true professional in his field," said General Manager/CEO Ricky Davis. "He will be missed." Editor of Publications Wayne Mattox, a 25-year veteran of the communications division and graduate of the University of Florida, was selected to replace Horne. Mattox worked alongside Horne and served as editor of the Kilowatt and Power Line (bill insert), and also served as one of the co-op's spokespersons. Davis said, "We were fortunate to have a person already on staff with Wayne's professional credentials. He will do a great job in managing our communications efforts." Mattox has also been recognized with several communications awards and is also a Certified Cooperative Communicator.

Mattox

HOLIDAY ELECTRICAL SAFETY TIPS...Holiday lights help make the season beautiful. They can also cause home fires. To keep your family safe:

- Look at each string of lights carefully. If any are cracked or damaged, buy new ones.
- When you buy new lights, look at the box for a label that shows they have been tested for safety, such as ETL or UL.
- Follow the directions on the box. It will tell you how many strings to use together.
- Hang or mount light strands carefully to avoid damaging the cord's insulation.
- Do not plug in too many things at one time. Use a surge protector.
- Unplug all holiday lights when you go to sleep or leave home.
- Plug outdoor decorations into outlets protected by Ground Fault Circuit Interrupters (GFCIs) to prevent shock.
- Automatic timers can be used to ensure that lights are not left on by mistake. These are available for indoor and outdoor use.
- Do not put electrical cords under rugs. Try to keep them away from places people walk.
- When replacing a holiday bulb, be sure to use the correct bulb size (wattage) that is right for the fixture.

The General Manager's Report

Ricky Davis

Trustees okay small rate increase; power cost adjustment will be lower

Following a careful review of Clay Electric's financial conditions, the board of trustees decided last month to approve a small rate increase that will be effective Jan. 1, 2011, pending review by the Public Service Commission.

The board also approved an increase in our monthly customer charge. The board felt these measures were necessary to maintain the cooperative's financial health. In addition to these changes to the residential rates, similar changes were approved for the co-op's other rate classes.

So why is a small rate increase necessary? We've seen our operational expenses climb in the past few years, just like many of you have seen the cost of groceries, fuel and various commodities go up. The price of conductor (wire), distribution transformers and related equipment, along with other important components, continues to rise. We've absorbed some of these rising expenses through efficiency and productivity improvements, and by delaying some projects and purchases.

We reduced our contract construction workforce and moved some of our employees to cover those assignments. We've done quite a bit to counter all the price increases, but we reached a point where we can't continue to absorb growing expenses.

As many of you know, we don't change our rates very often. In the last 18 years, we've increased our base rates once by 1.5 percent, while the cost of running Clay Electric has more than doubled.

As I mentioned, the board of trustees approved an increase in our monthly residential customer charge. Our customer charge will go from \$11 to \$14, effective Jan. 1, 2011. The customer charge (a common utility practice across the country) helps us recover expenses associated with maintaining members' active accounts and keeping our distribution system in tip-top shape so it's safe and reliable.

We're also reducing our Power Cost Adjustment (PCA) on Jan. 1, which will help lessen the impact of a rate increase. Utilities charge a PCA to help offset fluctuations in the price of wholesale electricity due to rising or falling generation fuel expenses.

Currently, our PCA is 2.84 cents per kWh. Effective Jan. 1, the PCA will drop to 2.55 cents per kWh. The PCA is being lowered thanks to a legal settlement between our wholesale power supplier (Seminole Electric Co-op) and CSX railroad. This settlement reduces the cost of power for us and the nine other electric distribution co-ops served by Seminole.

Our current rate for 1,000

kWh is \$113.50.

With the new rate, plus the lowered PCA and the higher customer charge, members who use 1,000 kWh will see an increase of only 80 cents in their monthly bill.

Many of our members use more than 1,000 kWh per month. On average, our residential members use 1,238 kWh a month. The net increase on this average usage amount will be less than \$2.

Of course, there are additional charges, taxes and fees that can impact your bill. For example, some members pay a slightly higher customer charge when they have subdivision lighting.

Some counties charge a public service utility tax, and there are other government imposed taxes and fees that impact what you pay for electricity.

We're always reluctant to increase our rates, but it's important that your cooperative remains on sound financial footing.

These small increases in our rates and customer charge will help us cover our expenses and allow us to continue to provide you with excellent service and competitively priced power. We always appreciate the opportunity to serve you!

Devices are likely energy saving scam

A so-called “energy-saving” device being sold for hundreds of dollars is little more than a scam, officials warned.

Sherman Phillips, Clay Electric’s manager of Energy Services, said he has been approached by at least four companies trying to sell the devices to co-op members.

“Every few years there seems to be a resurgence of a so-called new product on the market that will reduce a member’s electrical usage by 15 to 40 percent,” he said. “These capacitor-based products really don’t save as much as advertised. Over the years, I have monitored residential and small commercial motor and compressor loads with and without these type products installed. The energy savings just isn’t there to justify recommending their use as an energy saver.”

Sold under different names, the gadgets are all basically the same gray boxes. Inside the box are some capacitors.

“It does save you energy—it just takes you about 70, 80, 100 years to get the payback,” said Brian Sloboda, a program manager at National Rural Electric Cooperative Association’s Cooperative Research Network.

The capacitors are just batteries. As the power fluctuates, the batteries in theory kick in and level everything out.

The devices are being sold online as well as through newspaper ads and door-to-door.

Several independent observers have tested the devices. The Electric Power Research Institute tried one claiming to provide a 30 percent energy savings. EPRI found it saved 0.23 percent. At the University of Texas at Austin, the best researchers could get was a 0.06 percent reduction in electric use for an average home.

“These are people who ought to take the \$400 and buy some insulation,” Sloboda said.

“The newer the appliances and equipment you have, the less effective these products become,” Phillips said.

He also pointed out that most of these type of products offer surge protection as a side benefit.

In the end, CRN’s energy-efficiency advice to consumers is to go for the proven methods, such as installing compact fluorescent bulbs, turning off and unplugging appliances when not in use, and sealing leaks. If you get a sales pitch for some incredible energy-saving device, take a careful look at what you’re being sold and how.

“Anything that says it will condition your power or make your motors run better inside your home, just stay away from it, you don’t need it,” Sloboda said. And, he added, keep this in mind: “If there were a device that really did this, Wal-Mart would sell it.”

Weatherization assistance available from Department of Energy

Most people would like to save energy dollars by making their home more efficient, but not everyone can afford the improvements. As a result of the federal stimulus package, the U. S. Department of Energy’s (DOE) Weatherization Assistance Program has a goal of weatherizing one million low-income homes per year.

Weatherization is the process by which homes are made more energy efficient. This is accomplished through a series of relatively easy energy conservation measures and repairs. Homes that have been weatherized will require less energy to heat and cool, resulting in lower utility bills and a higher standard of living for individuals. The DOE

estimates the average home could save \$358 a year in energy costs through weatherization.

Households with incomes at or below 200 percent of the national poverty level are eligible for the Weatherization Assistance Program. For a family of four, that’s an income limit of \$44,100. Each home has different needs; the stimulus bill allows an average of \$6,500 to be spent on each home. Program participants receive a professional energy consultation with an analysis of energy bills, a blower-door test to locate air leaks and advice on how to be more efficient. Workers then arrive to make energy upgrades like insulating walls and roofs, sealing air leaks, and installing

more efficient heating and cooling systems.

For details, or to apply for the weatherization program, contact the following agencies.

Programs by county:

To inquire about assistance from the Low-Income Home Energy Assistance Program, locate the listing for your county and contact the provider.

Applications are only available by contacting the providers listed and are not available on the internet.

2) Baker County - Northeast Florida Community Action Agency, Inc.: (904) 259-4481

Continued on page 7

Some tax credits for efficiency improvements expire Dec. 31

Members of Clay Electric have less than two months to take advantage of tax credits that can help them save energy and reduce their utility bills with more energy-efficient windows and doors, insulation, and heating and cooling equipment, according to Sherman Phillips, Clay Electric's manager of Energy Services.

"If a member was considering making an energy efficiency upgrade in one of these areas, they would need to get to work on the project very soon in order to qualify for these federal tax credits," Phillips said.

Measures that qualify include replacing windows, doors, or roofs with materials that reduce a home's heat loss or gain; adding insulation; replacing certain air conditioners; and installing air-source heat pumps, hot water boilers and biomass stoves.

Homeowners can recover 30 percent--up to \$1,500-- of costs associated with buying and installing heating, ventilation and air conditioning systems and biomass stoves. Installation costs are not covered for windows, doors, roofing and insulation.

Energy Star, a joint program of the U.S. Department of Energy (DOE) and the U.S. Environmental Protection Agency,

Typical bulk insulation products, such as blow-in fibers, can qualify for the tax credit. The tax credit does not include installation.

Is it conservation or efficiency?

What's the difference between energy conservation and energy efficiency?

These terms are sometimes used interchangeably but they actually have different meanings.

Energy conservation means doing without or doing with considerably less.

Energy efficiency is using energy more wisely. The definition is the ability to produce a desired effect or product with a minimum of effort, expense, or waste.

With the slower economy, many people are more interested in staying in their homes and therefore learning about how they can improve their home's energy efficiency for economic reasons. Homeowners have also become more aware of how their energy use and decisions affect the environment.

Conservation and efficiency can both have a desirable outcome when it comes to energy usage.

Many people think of conservation as sacrificing.

But it can be as simple as turning off appliances when they are not in use or adjusting the thermostat to the correct setting when no one is home. Another example is hanging laundry outdoors when the weather is nice instead of relying on the dryer.

Energy efficiency means:

- Using advanced and state-of-the-art technologies to provide better quality energy services with less energy.
- Getting the most productivity from every unit of energy.
- Getting the desired energy services — comfortable homes, profitable businesses, convenient transportation — with less energy use, less air pollution, and lower total cost.
- Using energy wisely.
- Eliminating energy waste.
- Using technology to easily reduce energy use without having to daily "remember" to do it yourself.

Continued on page 6

provides guidelines on what qualifies for the tax credit at www.energystar.gov/taxcredits.

Tax credits are beneficial as they directly reduce, dollar for dollar, any taxes you owe.

If a homeowner is interested in renewable energy, the government also offers a renewable energy tax credit that expires Dec. 31, 2016. That credit covers 30 percent of the cost of materials and installation for solar panels, solar water heaters and geothermal heat pumps, for both new

and existing homes.

Members interested in discussing their electricity usage or obtaining advice on what system makes sense for their home and lifestyle should contact their member relations representative through their local district office. The co-op provides personal energy advice at no cost.

For a list of energy efficiency assistance available, visit the Database for State Incentives for Renewables and Efficiency, a project funded by DOE, at www.dsireusa.org.

Tinker Bell featured in new energy awareness campaign

From National Rural Electric Cooperative Assn.

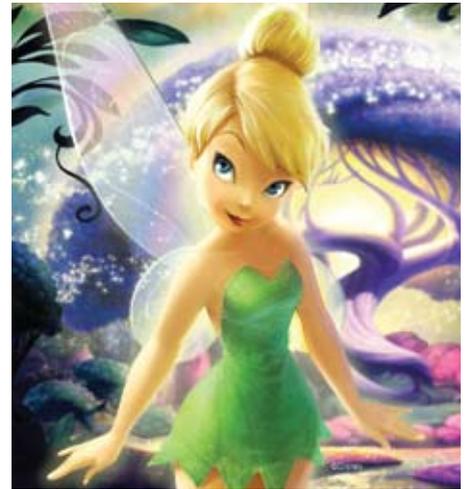

Looking to boost support for energy conservation in the home, the Department of Energy and the Advertising Council have turned to a new spokesperson, sort of: Tinker Bell. Tinker Bell is no kid — she hit the big time in Walt Disney's animated picture Peter Pan back in 1953.

But planners believe the cinematic sprite's leading role in a series of public service announcements will help inspire youngsters, and their parents, to establish positive energy efficiency practices.

It won't be a minute too soon, DOE and the Ad Council said. By 2030, global energy demand is expected to increase by 50 percent over 2005 levels, while U.S. demand will rise by 20 percent over the same period.

Families can help reduce that demand growth by becoming more energy efficient, the sponsors said. According to a national online survey of "tweens" — youngsters between 8 and 12 years old — 87 percent believe that saving energy is important.

The announcements — which appear in television, outdoor and web form — use scenes from Tinker Bell's new movie to educate 8- to 10-year-olds how to save energy.

Tinker Bell is featured in some new advertisements to promote energy conservation.

Is it conservation or efficiency?

From page 5

Conservation and efficiency, while they do not mean the same thing, they can be used together to create win-win solutions.

By keeping both in mind, four major consumer and societal benefits can be achieved: saving consumers money, increasing comfort, protecting the environment and enhancing the economy.

When energy efficiency is combined with smart energy conservation practices — like turning off lights, TVs, computers and electronics, that you're not using — all of the benefits above are compounded.

SCRIPTURE

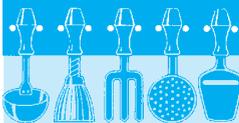

Don't wear yourself out by trying to get rich; be wise enough to know when to quit.

Proverbs 23:4

RECIPE CORNER

Strawberry cake

Prepare strawberry cake as directed on the box, but make 3 layers. Heat 3/4 cup milk & 1/2 cup sugar in saucepan. Pour hot mixture over the cake while it's cooling.

Glaze - mix 1 cup sugar, 2 Tbsp cornstarch & 1 cup water. Cook over medium heat until thick & bubbly. Add 1 pkg strawberry jello. Cool

in fridge about 1 hour. Pour glaze between the first and second layers.

Icing - mix 8 oz. softened cream cheese, 1/2 cup sugar, 1 cup conf. sugar. Blend in 8 oz. Cool Whip. Ice the top and sides, then refrigerate.

Our thanks to member Olene Mitchell for providing this month's recipe.
