Clay Electric Cooperative, Inc.

A Touchstone Energy® Cooperative 

NEWS *IN BRIEF...*

KEN HINTON RETIRES FROM PALATKA DISTRICT...

Ken Hinton of the Palatka District retired from Clay Electric on Sept. 8. Hinton was the district engineer for 41 years. Bill Thompson, director of District Operations, presented him with a plaque during a retirement luncheon. Thompson said Hinton could be counted on to do an outstanding job for the co-op. Jim Beeler, district manager for Palatka and Salt Springs, said Hinton has a wonderful work ethic. "I didn't have to worry about the engineering department with Ken here," he said.

Hinton

IN OTHER NEWS, Bootsie Richardson, a power system operator in the co-op's Control Center, passed away on Aug. 23. She had 25 years of service. Retiree Ed Taylor, who served as district line supervisor in the co-op's Salt Springs District for many years, passed away on Sept. 8. Taylor, who retired in 1997, had 29 years of service.

AVERAGE BILLING PLAN CAN HELP WITH BUDGETING...

The Average Billing plan is a payment plan which provides participating customers with a more predictable bill that fluctuates less throughout the seasons. By knowing the approximate amount of your electric bill each month, budgeting becomes easier. Participants are billed each month based on a 12-month average, including the current month, plus or minus a small adjustment on the remaining balance. Qualifications include a good payment history for the past 12 months at the current residence. Please contact your district office if you are interested in this program.

FREE HOME ENERGY AUDIT CLASS OCT. 26-27...

Santa Fe College is offering a free class on Basic Home Energy Auditing Oct. 26-27 from 6-9 p.m. at the Center for Innovation and Economic Development in Gainesville. The six-hour course will show you how to inspect your residence to find problems that are costing you money on utility bills. Whether you own your home or rent, you will gain a better understanding of how energy is used (and wasted) in your home. This class is strictly for informational purposes and does not endorse specific products or retailers. Please contact Michael Wohl at (352) 381-7080 or michael.d.wohl@sfcollge.edu for more information.

CLAY ELECTRIC NOW ON FACEBOOK... Clay Electric joined the social networking site several months ago. The Member & Public Relations Department is using its Facebook presence to connect with members and others who 'like' us. Wayne Mattox, manager of communications, says the communication staff's ability to make use of multiple mediums is important.

"We've been looking at expanding the ways we can communicate with our members, and we think Facebook will help," Mattox said. If you're on Facebook, you can visit Clay's site at www.facebook.com/ClayElectric

KILOWATT

SEPTEMBER 2011

VOLUME 42 NUMBER 5

KILOWATT is published six times a year (in January, March, May, July, September and November) by Clay Electric Cooperative, Inc., Highway 100 West, Keystone Heights, Florida, as an informational and educational service to its member-owners. SUBSCRIPTION RATE: \$1 a year, to Clay Electric members. Periodicals class postage paid at Keystone Heights, Fla. and at additional mailing offices. USPS 783-900; ISSN 1087-4747.

BOARD OF TRUSTEES

Meets September 22 & October 27 in
Keystone Heights at 12:30 p.m.

Laura Dean - President
Keystone Heights - District 1
John Henry Whitehead - Vice President
Lake Butler - District - 7
Susan Reeves - Secretary
Hawthorne - District 3

The General Manager's Report

Ricky Davis

Recalling the big storms of 2004

You probably watched some of the TV coverage of Hurricane Irene as it moved up the Eastern Seaboard in late August, leaving several million people without power.

In the aftermath of the storm, power company officials in the Northeast scrambled to rebuild their damaged distribution systems. Their task to restore service was slowed by huge numbers of downed trees on lines, plus the fact that Irene caused damage over a very large area.

Folks in New Jersey, New York, Vermont, New Hampshire and Maine aren't visited by hurricanes or tropical storms very often. These storms are a rare occurrence in the northeastern United States. The last major hurricane to hit New York was Gloria in 1985. While they're much more likely to know how to prepare for snowstorms in New England, a powerful hurricane is quite a different matter.

We know from experience what they're going through after Irene's visit. We've been there and we've done that. Most of you recall 2004, when Florida was battered by four hurricanes between mid-August and late September.

Our 2004 hurricane season began with Hurricane Charley in mid-August. Charley came ashore at Port Charlotte in southwest Florida and cut a path of destruction to near Daytona Beach. Millions were left without power. Charley exited the state before it caused widespread outages for us, but still, several thousand members experienced outages.

In early September, Hurricane Frances hit the east

coast of Florida near Stuart and slowly moved across the state before entering the Gulf of Mexico. Frances' far-flung winds pounded our service area for many hours, and because it was a slow-moving storm it dumped upwards of 18 inches of rain. About 70 percent of our members were left in the dark during the early morning hours of Sept. 5.

Within a few days, our workforce had swelled to around 800 as crews from other areas helped us rebuild our system. We had the majority of our members back on within a week, but restoration efforts in many isolated pockets were hindered by high water.

As our rebuilding efforts from Frances neared an end, Hurricane Ivan moved into the Gulf of Mexico. It appeared headed our way but turned westward and hit the Pensacola area with 130-mph winds and a destructive storm surge. Many picturesque seaside communities were destroyed. Utilities in that area said it would be a month before power could be restored. For many residents in Ivan's path, a loss of power was the least of their worries.

Hurricane Jeanne circled around the Atlantic Ocean, killed several thousand Haitians, and then headed toward Florida. On Sept. 25, Jeanne hit Stuart with 120-mph winds. Moving on a track nearly identical to the one taken by Frances, Jeanne moved inland and lost some strength, but its winds left 105,000 of our members without power the following day. We mobilized our workforce, and by Sept. 30 we had more than 700 personnel

rebuilding lines and replacing broken poles. Crews from as

far away as Minnesota and New Mexico helped us. By midnight on Oct. 1, all our members were back in service except for a few pockets of isolated outages.

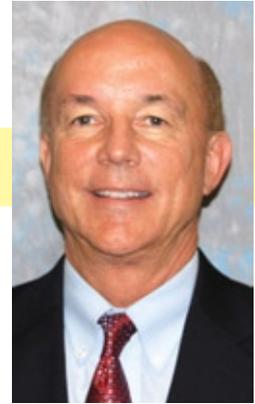

For many of our members, the hurricanes of 2004 were a grueling ordeal that taxed their patience and civility. As the outages continued with each storm, nerves were frayed. Food spoiled, folks suffered from the heat and humidity, people grew tired of eating out of cans and preparing meals on outside grills.

For some of our members, the hurricane season of 2004 brought personal tragedy. A teenage boy was killed by a falling tree on Fleming Island. A man died in Green Cove Springs while removing a tree pushed over by a storm. The state's death toll reached over 70.

For our employees, 2004 presented challenges on a scale never before seen. Common were the endless hours of hard work, sweat, heat, mosquitoes, ant bites, flooded fields, soaked clothes and tired feet inside wet boots that never dried out. The dedication and professional attitude that our employees displayed that year never wavered under a monumental challenge.

No one relaxed until the final account was back on.

So we know what they're dealing with up North after Irene... we've been there and done that.

Energy Star home built in Satsuma

By Kathy Richardson, Kilowatt editor

The home itself is fairly simple in design. It is a modern-looking contemporary home with combination stucco and lap siding exterior. The overall look of the home could be found in any subdivision in Florida. Perhaps the only telltale sign of its true extreme energy-efficient nature is the white metal roof.

The Satsuma home was recently certified as the first site-built Energy Star home in Putnam County.

Jason I. Sheffield, a state-certified building contractor and owner of The Ivey Group, built the home for Clay Electric Cooperative members Dave and Kathy Kudlo.

While this house is the first official Energy Star home Sheffield has built, he is no stranger to extreme energy efficiency. In fact, Kilowatt readers might recall the home that was featured in the May 2009 issue.

That home, which Jason helped construct, belongs to his parents. While not officially Energy Star, it is also extremely energy efficient and features a photovoltaic system and a geothermal heat pump.

Energy Star is a joint program of the U.S. Environmental Protection Agency and the U.S. Department of Energy that began in 1992. It began as a labeling program for computers and branched out to include appliances and much more. It

Kathy and Dave Kudlo are pictured with their builder, Jason Sheffield of the Ivey Group. Kathy is holding the official Energy Star certificate.

was further expanded to include residential and commercial construction. For new home construction, there are levels of Energy Star certification and requirements that vary from state to state.

The Energy Star label has become the national symbol for energy efficiency.

Energy Star homes use less energy, reduce emissions, increase home durability and cost less for consumers to maintain.

To earn the Energy Star certification, a home must meet guidelines for energy efficiency set by the US Environmental Protection Agency. These homes are at least 15 percent more energy efficient than homes built to the 2004 International Residential Code, and include features that typically make them 20-30 percent more efficient than standard homes. According to the Energy Star website, "Energy Star-qualified homes can include a variety of tried and true energy-efficient features that contribute to

improved home quality and homeowner comfort and to lower energy demand and reduced air pollution."

Earlier this year, when the Kudlos moved into their Energy Star home, it was the culmination of a dream several years in the making. They had been living in Hilton Head, South Carolina for many years.

"We are originally from Jacksonville and we came back to Florida to retire on the St. Johns River," Dave Kudlo said.

Dave said the idea to seek the Energy Star certification came to him at the beginning of the building process. He said energy conservation was a primary motivation.

The five criteria that make up an Energy Star home are effective insulation, high performance windows, tight construction and ducts, efficient heating and cooling equipment, and efficient fixtures and appliances. The first three Energy Star criteria represent the house envelope, which, according to Clay

Electric Energy Services Manager Sherman Phillips, is critical for an energy efficient home.

"The envelope of the house determines the operating cost of the heating, ventilation and air conditioning (HVAC) system, based upon your comfort level," Sherman said. "The more energy efficient the thermal envelope, the lower the operating cost will be."

Here's a breakdown of the Kudlo home with those five areas in mind:

1) The home was built using Insulated Concrete Forms (ICF) which provide an R-38 Thermal Mass Optimization insulation value with a nominal 6" concrete cavity. The ICF profile consists of 2.25" of foam on the inside, 5.75" concrete in the core, and 6.25" of foam on the outside, for 14.25" of exterior wall. The drywall is added on top of that. For the attic insulation, a 5/8" solar ply radiant barrier plywood sheathing system with a white standing seam metal roof system was installed. According to Sheffield, these two products have offered great results within the attic area.

"Based on constant monitoring within the attic area, the attic temperatures, throughout the spring and summer seasons, have directly correlated with the outside ambient temperatures," he said. In addition to the radiant barrier, a closed-cell polyurethane spray foam insulation was installed at the ceiling level. Sheffield said after extensive research, they decided to use Demilec's Heatloc Soy 200.

"We were able to achieve a high density value and great results from this product," he said. "The reason for spraying the insulation at the ceiling level was based on the house design encapsulating a drop-down soffit area that completely and fully housed the entire HVAC

ducting system."

This method kept all the ducts within the conditioned area of the home and eliminated the challenges of them being located in the attic, where they traditionally fight against the attic temperatures in an open and ventilated attic area.

2) The Kudlos went above and beyond Energy Star standards for their windows. The windows are Lo-E, triple paned and filled with argon gas. The solar heat gain coefficient of the windows is in the .22 to .26 range. Standard windows are around .30. It was important to Dave to have a lower solar heat gain coefficient on his windows. He noted that the windows were pricey, but he said the payback is immediate.

3) The overall construction of the home is essentially airtight. A blower door-test was done on the duct work during the rough-in phase of construction, yielding only two leaks. Because the home is relatively airtight, the home has fresh air added through the HVAC system.

4) The heating and cooling system is completely DC powered. It is a variable output unit and runs almost continuously, but often at a much lower speed than a standard system. Dave credits this system with keeping the home's air fresh and filtered.

5) All the appliances in the home are Energy Star, of course. In addition, all the home's lights are LED. Although fairly expensive and not required for certification, Dave likes the longevity

Sherman Phillips and Derek Hembree of Clay Electric are shown with Jason Sheffield, right, in the attic of the Kudlo home. This photo was taken on Sept. 1 in the middle of the day. They spent more than 10 minutes in the attic looking at the insulation and radiant barrier and the temperature was comfortable.

of the lights and the fact they put off virtually no heat.

The result of all the energy efficiency measures is an average monthly use of 641 kilowatt hours and an average bill of \$79.61. An average bill for a similar size home on Clay Electric's lines would be \$175. The Kudlos' home uses less power than that of an average apartment.

The Kudlo home has a Home Energy Rating System Index (HERS) of 46. That makes it 54 percent more energy efficient than the HERS Reference Home.

While the home is an energy miser's dream, Dave Kudlo says they have sacrificed nothing in terms of comfort. He noted they have "every imaginable electric device known to man," specifically mentioning a couple of refrigerators, a chest freezer, an electric boat lift and an electric golf cart, and that they pump and treat their own water.

Because of the home's extremely airtight design and state-of-the-art heating and cooling system, the temperature and humidity in the home remain consistent without any extra energy usage.

"You can walk from one end of the home to the other without

Co-op vehicle & equipment online auction begins Oct. 14

Clay Electric will offer its annual vehicle and equipment auction as an online event from Oct. 14 through Nov. 7. The auction event was online the past two years and has been well received.

Members can obtain information about the co-op's auction items (vehicles, tools, office equipment and miscellaneous products) by visiting George Gideon Auctioneers' web site (www.ggauctions.com). The auctioneer is located in Zellwood, Fla. Their phone number is (407) 889-2211 and their email is george@ggauctions.com.

Photos and information on each vehicle and other auction items will be posted on the

George Gideon website on Oct. 14. The inspection day for the vehicles is Nov. 3 in Keystone Heights at the Fleet Service building from noon to 4 p.m.

Successful bidders must pick up their vehicles and equipment items within one week of the auction closing. After Nov. 15, all items that have not been picked up will be disposed of by Clay Electric.

Vehicles include:

1999 Wells Cargo Trailer
1999 GM 1 ton diesel utility body
2001 GM 1 ton cargo van
2002 GM 1 ton gas utility body
2002 GM 1 ton gas utility body
2003 Chevy S-10
2003 Chevy S-10
2003 GM 1 ton 4x4 diesel utility body
2003 GM 1 ton 4x4 diesel utility body

Bryan Stanley and Ricky Heath of Fleet Services look over one of the 2003 GM 4x4 trucks with a utility body that will be available during this year's auction.

2003 Ford F-550 4x2 diesel C&C
2005 Chevy Impala
2005 Ford ½ ton cargo van
2006 Chevy Colorado
2008 Chevy ½ ton cargo van
2007 Ford F-550 4x2 diesel C&C

Equipment includes:

Miller welder: Millermatic 250X Mig
Robinair A/C machine: Cooltech 700 for R-134
Ingersoll Rand contractors air compressor: 2340S 9GH-AS with Honda engine
Mita digital copy machine: UV37 069747

Energy Star

From page 5

any temperature variation," he said.

The 2,000 square foot home has three bedrooms, two and a half bathrooms, and a large living room. The custom kitchen opens out to the living room, which showcases the view of the river. The couple wanted to be able to enjoy this unique feature from the comfort of their home.

Although not a builder himself, Dave made the subjects of energy efficiency and conservation his business. His wife says he's a researcher. She said he spent a tremendous amount of time looking into the many choices available for building a new home. She said she attended many home shows and builder's conferences with her husband as they worked their way through the mountains of information.

Kathy Kudlo said the couple built a home with a very similar floor plan in north Florida in 1978. She said the home was energy efficient for the time. The windows were high efficiency, and the home even featured one of the first solar water heaters. She said the reason for building with conservation and efficiency in mind at that time was primarily economic.

More than 30 years later, the decision to seek the Energy Star certification on the house being

constructed in 2010 came before any ground was disturbed.

"To me, being green is 90 percent energy efficiency and 10 percent everything else," Dave said.

Dave said unlike the home they built in the 1970s, the cost was not a major factor in the decision to build an Energy Star home this time, nor was the return on investment.

"Financially, the energy-saving components in this house are equivalent to an energy price index annuity. It's forever and it's tax free and it only gets better with time," Dave said.

Sheffield said achieving an efficient house is not difficult if you take the time to understand the critical components of construction. He said homeowners and builders should consider the building shell, the roof materials (reflective metal covering and radiant barrier), roof overhangs (a minimum of 36"), window specifications (insulated double/triple pane), spray foam insulation, HVAC ratings (SEER 15+) and appliance selection (Energy Star).

The Kudlos said many people think conservation and efficiency mean being uncomfortable or doing without. "That is just not the case. This house is more comfortable than any house we've ever lived in," Dave said.

1973 PLYMOUTH 2 dr satellite, looks like a road runner w/emblems-slap-stick trans, rally dash, etc. \$8,500. 386-328-2971 Walden

SCRIPTURE

Let love and faithfulness never leave you; bind them around your neck, write them on the tablet of your heart. Then you will win favor and a good name in the sight of God and man.

Proverbs 3: 3-4

Recipe Corner

Chicken Taco Casserole with Cornbread Topping

Ingredients

- 1 can yellow corn
- 1 can black beans- drained and rinsed
- 1 can tomato sauce
- 1/2 lb. chicken breast- diced
- 1 pack of taco seasoning mix
- 1 cup cheddar cheese-shredded
- 1 package of corn muffin mix (Jiffy)

Preparation

Cook diced chicken thoroughly in skillet. Add corn, beans, tomato sauce & taco seasoning. Bring to boil for 1 minute. Pour into 1 quart casserole dish and sprinkle with shredded cheese. Make corn muffin mix according to directions. Spread mixture over casserole. Bake at 375° for 20 minutes. Enjoy!
